Sequence 582

A,

The present invention describes a monoclonal antibody which can react specifically with ganglioside GD3. The antibody and its derivatives are useful in the diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a protein used in the exemplification of the invention

Claim 41; Page 168-172; 183pp; Japanese.

activity in cancer.

WPI; 2001-266143/27.

Nakamura

ζ,

Niwa بر :,

New human type complementation-determining region-transplanted antibody and derivatives against ganglioside GD3, useful in diagnosis and therapy of e.g. tumors, with low antigenicity, little side effects but potent

The antibody may be a monoclonal antibody or its fragments. The antibody is combined with a radioactive isotope, protein or small drug in the treatment and diagnosis of cancer

The ant and its derivatives are useful in diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a protein us the exemplification of the invention

                                                                                                                                                                                       The present invention relates to novel recombinant anti-EpCAM (human epithelial cell adhesion molecule) antibodies comprising an amino acid sequence defining an immunoglobulin light or heavy chain framework region. Sequences of the present invention are useful for the diagnosis, prognosis and treatment of cancer. They are also used in gene therapy. The present sequence is KS antibody heavy chain-interleukin 2 (II-2) fusion protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                               Sequence 579
                                                                                                                                                                                                                                                                                                                                      New recombinant anti-EpCAM antibody having an amino acid sequence defining an immunoglobulin light or heavy chain framework region, for the diagnosis, prognosis and treatment of cancer.
                                                                                                                                                                                                                                                                                                              Disclosure; Page 80-82; 82pp; English.

The fusion protein comprises a non-interleukin-2 (IL-2) modety fused to a mutant IL-2 modety. It is useful for preparing a composition for treating cancer, viral infections or immune disorders. The fusion protein is also used in gene therapy. The present sequence is dI-KS-ala-IL2 (D20T) variant protein comprising dI-KS heavy chain fused to human IL-2 (D20T) variant protein. This sequence is used to illustrate the method of the invention

The invention relates to a novel antibody variable region, where the antibody variable region specifically binds to human cell surface glycosphingolipid GD2. An antibody variable region of the invention has cytostatic activity, and may have a use in gene therapy. The antibody mabe used for treating cancer. The nucleic acid or cell is useful for manufacturing a medicament that may be used for treating diseases such a cancer. The present sequence represents an immunoglobulin heavy chain-IL 2 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New modified m14.18 antibodies with reduced immunogenicity specifically bind the human cell surface glycosphingolipid for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 575

                                                                                                                                                                                                                                                                                                                                     The invention relates to cytokine fusion proteins with increased therapeutic index and methods for increasing the therapeutic index of such fusion proteins. The fusion protein comprises a non-interleukin-2 (IL-2) moiety fused to a mutant IL-2 moiety. It is useful for preparing a composition for treating cancer, viral infections or immune disorders. The fusion protein is also used in gene therapy. The present sequence is dI-NHS76 (gamma4h) (FN>AQ)-ala-IL2 (D20T) variant protein comprising dI-KS heavy chain fused to human IL-2 (D20T) variant protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New fusion protein comprising a non-IL-2 moiety fused to a mutant IL-2 moiety, useful for preparing a composition for treating cancer, viral infections or immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    04-DEC-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문
                                                The invention relates to cytokine fusion proteins with increased therapeutic index and methods for increasing the therapeutic index of such fusion proteins. The fusion protein comprises a non-interleukin-2 (IL-2) molety fused to a mutant IL-2 molety. It is useful for preparing a composition for treating cancer, viral infections or immune disorders. The fusion protein is also used in gene therapy. The present sequence is dI-NHS76 (gammazh) (FN>AQ)-ala-IL2 (D2OT) variant protein comprising dI-KS heavy chain fused to human IL-2 (D2OT) variant protein. This sequence is used to illustrate the method of the invention

The present invention relates to novel antibodies that specifically bind covery late activation (VLA-1; betal containing integrins) antigens and complete containing integrins and complete containing these antibodies to treat immunological disorders. The conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal conditions (e.g. thinitis, respiratory distress syndrome, asthma, containing the conditions (e.g. inflammatory distress syndrome, asthma, containing the conditions (e.g. inflammatory bowel disease, Crohn's disease, contestinal conditions (e.g. inflammatory bowel disease, Crohn's disease, contains and colorectal cancer), complete containing the conditions (e.g. through bowel disease, repriatits, irritable bowel syndrome, colitis and colorectal cancer), complete containing the conditions (e.g. through bowel disease, repriatitis, aplastic anaemia, containing the conditions (e.g. through bowel disease, remaining the containing the conditions (e.g. atherosclerosis), thyroiditis, aplastic anaemia, containing the conditions (e.g. through bowel disease, remaining the conditions of the conditions 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New anti-VLA-1 antibodies are useful for preventing or treating VLA-1-mediated immunological or inflammatory disorders, e.g. psoriasis, ecze burns, dermatitis, and abnormal proliferation of hair follicle cells o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13-APR-2001; 2001US-0283794P

mediated anti-VLA-1 antibodies are useful for preventing or treating VLA-1-iated immunological or inflammatory disorders, e.g. psoriasis, eczerns, dermatitis, and abnormal proliferation of hair follicle cells o

Example 23; Page 92; English

WPI; 2003-093009/08

CC to very late activation (VLA-1; betal containing integrins) antigens and CC methods of using these antibodies to treat immunological disorders. The CC anti-VLA-1 antibodies are useful for preventing or treating VLA-1-CC mediated immunological or inflammatory disorders such as skin related CC conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal CC proliferation of hair follicle cells), fibrosis (e.g. kidney or lung CC fibrosis), allergic rhinitis, respiratory distress syndrome, asthma, CC bronchitis, tendonitis, respiratory bowel disease, Crohn's disease, CC intestinal conditions (e.g. inflammatory bowel disease, Crohn's disease, CC astoliar diseases (e.g. atherseclerosis), thyroiditis, aplastic anaemia, CC periarteritis nodosa, Hodgkin's disease, rheumatic fever, osteoarthritis, carbitritis, systemic lupus erythematosus and multiple sclerosis), renal CC authoritis, systemic lupus erythematosus and multiple sclerosis), renal CC dilure, sarcoidosis, naphrotic syndrome, Behcet's syndrome, gingivitis, CC upolymyositis, hypersensitivity, (e.g. delayed type hypersensitivity or CC compositis, hypersensitivity, graft and transplant rejections, graft CC upocardial ischaemia or endotoxin shock syndrome. The present sequence is conducated protein, hsAQC2 heavy chain mutant protein, hsAQC2 invention relates to novel antibodies that specifically bind

            This sequence represents the heavy chain of a selected phage antibody against human OX40 receptor. OX40 receptor, family which is expressed on ACT-4, ACT3) is a member of the TNF receptor family which is expressed on activated CD4+ T cells. Triggering of this receptor enhances the proliferation of CD4+ memory cells. A human OX40 receptor specific phage antibody (scFv) represents the agonistic binding molecule of the invention which is capable of binding to and stimulating the human OX-40-receptor. The binding molecules of the invention are useful as a medicament for treating neoplastic, viral or bacterial disorder or disease, for stimulating T-cells in vitro and for enhancing the immune response in a human or animal against a tumour, bacterial on human which involves, administration to the human, where the modulating includes in the state of the human, where the modulating includes

SCF is also known as mast cell growth factor, steel factor or c-kit ligand. Antibodies of the invention are useful for preparing compositions for treating asthma. They are also used in gene therapy. The present sequence is human SCF antibody heavy chain variable and constant
                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 445 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified human antibody that binds to stem cell factor protein, useful for preparing a composition for treating asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-523500/49

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
